

**WABCO Ultrasonic Leakage Detector (400 606 410 0)**

The factors of time and efficiency play an increasingly important role in the modern commercial vehicle workshop. Long repair and idle times lead to high costs and dissatisfied customers. In order to counteract this factor, WABCO is launching a new device - the Leakage Detector - which uses the latest ultrasound technology to enable leaks in a vehicle's compressed air system to be identified quickly and easily.

**The benefits for your workshop**

- The use of ultrasound technology enables your colleagues to identify leaks in the compressed air system substantially faster than with standard leak detection methods.
- Using a flexible sensor, leaks can be detected quickly and reliably, even in parts of the vehicle that are hard to access.
- Thanks to the soundproofed headphones, loud ambient noise in the workshop will no longer affect the search for leaks.
- The Leakage Detector is intuitive to use and completely maintenance-free. Only the integrated batteries need recharging occasionally.
- Unlike conventional methods, the Leakage Detector enables you to do away with corrosive or harmful substances altogether.
- Increase customer satisfaction with shorter repair and downtimes.
- Benefit from the usual high WABCO quality.
